

Pop Quiz:

Is it okay to let a horse eat snow as a water source?

EQUINE GUELPH
helping horses for life

Answer: from the Code of Practice for the Care and Handling of Equines <http://www.nfacc.ca/codes-of-practice/equine-code#section3>

Snow as a Water Source

There is limited research on snow as a sole water source for horses. Given the scientific research on the water needs of horses in general, snow alone will not meet their water requirements. Some research shows that limiting liquid water intake can lead to reduced feed intake, a particular concern in the winter months given the increased energy needs of horses in cold temperatures. Water requirements may even increase in cold temperatures because water intake increases as feed intake increases.
