Checking Hay Moisture

The importance of checking hay for moisture content has implications in both nutrition and fire safety!

Image of hay dangerously close to combustion kindly provided by
Teutopolis Fire Department Illinois, USA.

When hay is baled, it should not be higher than 18 to 22 percent moisture. At higher levels of moisture, bales lose large amounts of dry matter caused by excessive heating and molding. In severe cases, spontaneous combustion is possible. The University of Missouri Extension has a great article: Making and Storing Quality Hay.

Manure Management

A 1000 pound horse produces at least nine tons of manure each year. Without a well-thought out plan for collection, storage and disposal of manure, you could be faced with many issues such as: parasites, bacteria-harboring mud, water pollution, odour problems, flies and a host of health care concerns.

Quick Response is Key in Equine Antimicrobial Resistance

Veterinarians have been warning horse owners about the dangers of antibiotic resistance for years. Scott Weese, DVM, DVSc, Dipl. ACVIM, a professor in the University of Guelph's Ontario Veterinary College's Department of Pathobiology, claims that many members of the equine community still don’t understand the concept and importance of bacterial resistance.
