- Tourniquet
- Wooden tongue depressor
- Wound wash bucket
**Other items to have nearby:**

- Bandages
- Stall/standing bandages
- Cloth or soft bra for blind fold
- Cotton lead rope & halter

If your tack locker lives in an unheated area and stores your first aid kit, there are certain items that may need relocating once temperatures dip below zero.

1. Topical creams and ointments - hard to spread once frozen, separation can occur and the active ingredient may not withstand the cold.

2. Injectable medications – many do require storage in the fridge but others must be kept at room temperature. Always check with your veterinarian where to store medications.

3. Oral medications – while some medicines can withstand a wide temperature range, certain ones require storage between 2°C and 8°C, and others can be irreversibly degraded even by brief periods at sub-zero temperatures – check the bottle and if you do not see any directions, consult your veterinarian.

Also check expiration dates and dispose of any medications that look damaged or past their effective date safely – your veterinarian will often take them off your hands or will be able to advise best practices.
